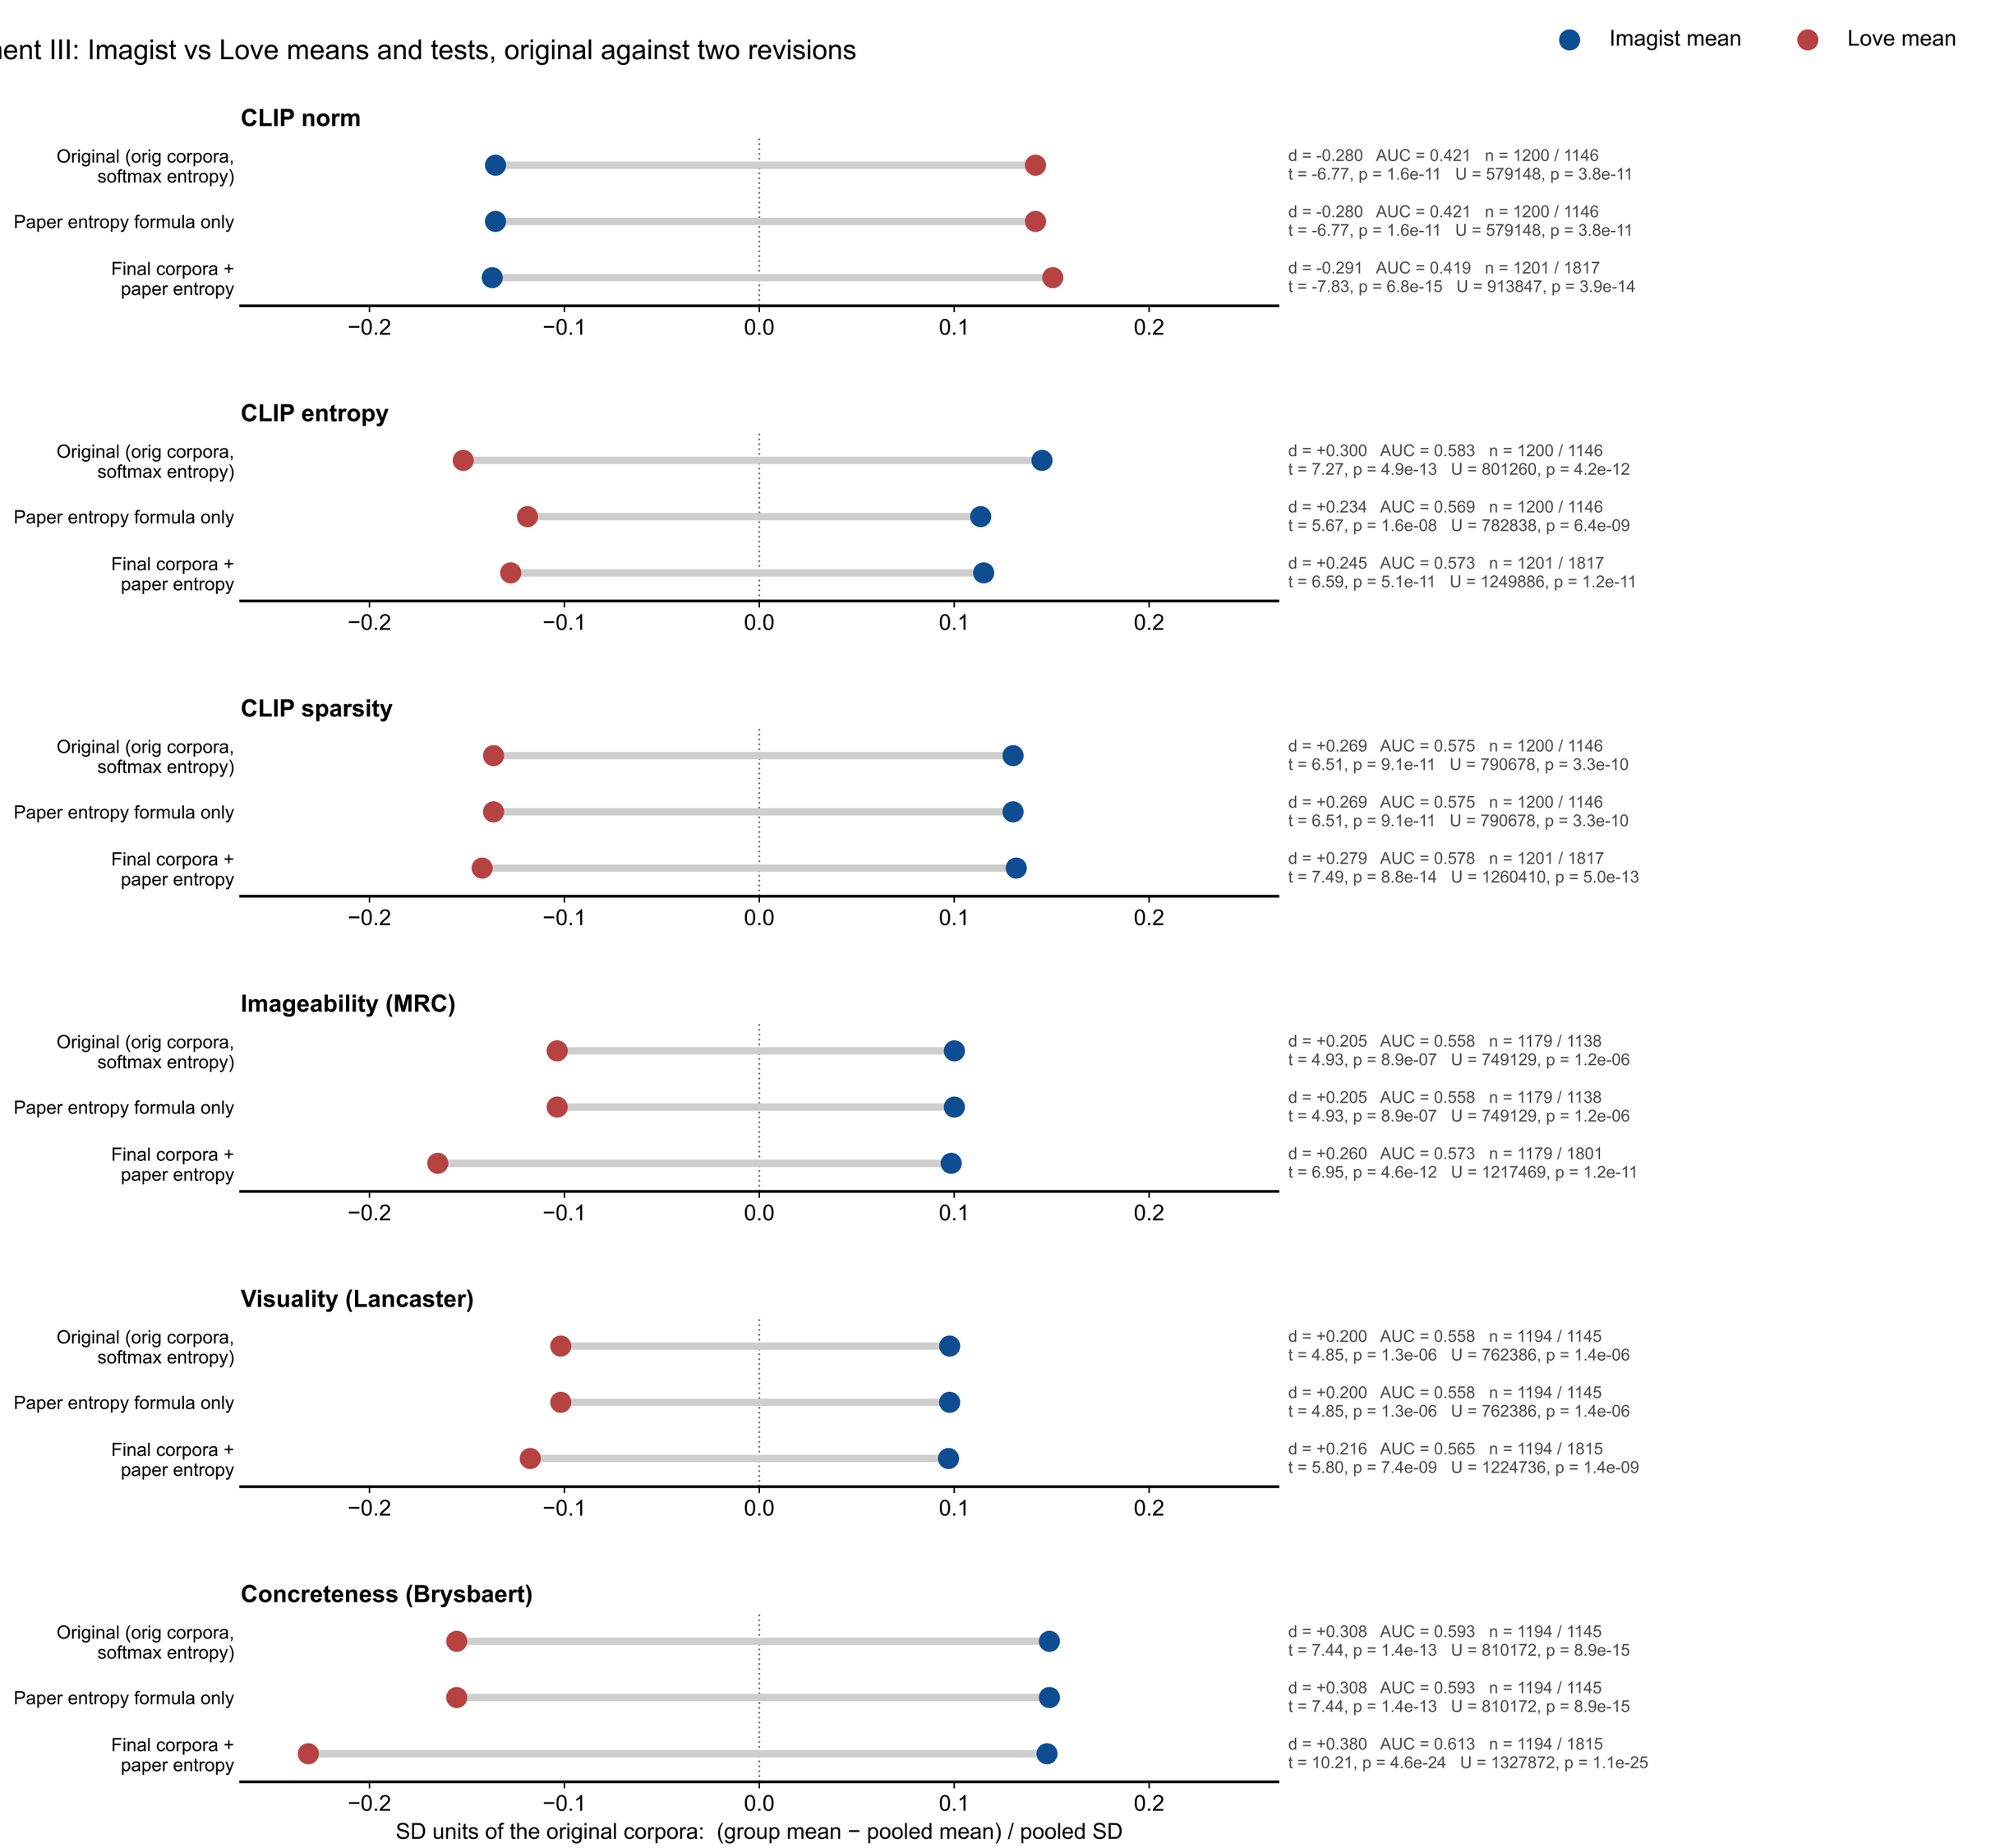
Experiment III: Imagist vs Love means and tests, original against two revisions



d = (mean_imag − mean_love) / √((var_imag + var_love)/2); AUC = U / (n_imag · n_love) = P(random Imagist line > random Love line). t: two-sample t-test; U: Mann-Whitney U.
(n.s.) = not significant after Bonferroni (0.05 / 6). x = (mean − μ0) / σ0, μ0 and σ0 pooled over all lines of the original corpora; the gap between the dots ≈ Cohen's d.
Entropy is standardised with the run's own formula (softmax for the original, |e|/Σ|e| for the others), so its position shows the gap, not a shift between formulas.
