Experiment III: change against the original run (original corpora, softmax entropy)

Paper entropy formula only

Final corpora + paper entropy

Change in effect size (run − original)

	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)
Cohen's d	0	-0.066	0	0	0	0	-0.011	-0.055	+0.010	+0.055	+0.016	+0.073
AUC	0	-0.013	0	0	0	0	-0.002	-0.010	+0.003	+0.015	+0.007	+0.020

Change in effect size: 0.05, 0.00, −0.05

Change in −log10 p (run − original)

	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)
t-test	0	-4.5	0	0	0	0	+3.4	-2.0	+3.0	+5.3	+2.3	+10.5
Mann-Whitney U	0	-3.2	0	0	0	0	+3.0	-0.5	+2.8	+5.0	+3.0	+10.9

Change in −log10 p: 10, 5, 0, −5, −10

% change of group mean

	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)	CLIP norm	CLIP entropy	CLIP sparsity	Imageability (MRC)	Visuality (Lancaster)	Concreteness (Brysbaert)
Imagist mean	0		0	0	0	0	0		0	0	0	0
Love mean	0		0	0	0	0	+0.1%		-0.1%	-1.0%	-0.3%	-1.3%

% change of group mean: 1, 0, −1

Effect size: Δd = d_run − d_orig, d = (mean_imag − mean_love) / √((var_imag + var_love)/2); ΔAUC = AUC_run − AUC_orig, AUC = U / (n_imag · n_love).
Δ −log10 p = −log10 p_run + log10 p_orig: +1 = p ten times smaller (stronger evidence). % change of mean = (mean_run − mean_orig) / |mean_orig| · 100.
Hatched = entropy formula differs, so the means are on different scales. Raw n, U, t, p and significance: figs/compare/heatmap_raw_values.csv.
